

New Pico Technology Coil-on-plug (COP) and signal probe

Pico Technology has introduced a new Coil-on-plug (COP) and signal probe for the non-contact testing of Coil-on-plug ignition coils, spark plugs, injectors, inductive actuators and other high-voltage switching signals.

The new Probe features an easy-grip handle, a flexible shaft to allow easy access even when space is restricted and has an improved pick-up to suit a wider range of components.

- Find misfires fast
- Quickly compare secondary signals, faster than testing the primary
- Can also be used to investigate injectors and other inductive actuators
- Works with all automotive PicoScopes
- Flexible design allows for easier access to hard-to-reach components
- No batteries required

Compatible with any Pico Automotive scope, you can also use the COP and signal probe to pick up injector and actuator waveforms on a wide variety of vehicle makes and models. You can buy the probe on its own or with a special grounded cable.
