

Rotary Position switch from a conventional Chassis Ear Kit. The Steel-man Kit we have has a Volume control Knob and a 9V Battery power source.

I bought Piezo Transducers (Buzzers) from RS Components and Rare Earth Magnets of a slightly Larger Size. Then Glue the Transducers to the Magnets, then some hot glue over the Soldered Joints and Heat shrink over the Whole Lot.

I Used a conventional BNC Cable and fitted a 3.5 mm mono plug on the end.

I used Microphone Or Door Bell type Shielded single Core wire.
